Acoustic and Electrical Constants of the Telephone. M. Wien. (Ann. d. Physik, 4. 8. pp. 450-458, March, 1901.)--The condition of the correct translation of speech by a telephone receiver is that the relative amplitude of different tones remains unvaried. To determine how far this condition is fulfilled, the following three points must be examined: --(1) The variation of current with frequency, at constant e.m.f. (2) The variation of magnetic induction with frequency, at constant current. (8) The variation of the amplitude of the diaphragm at constant magnetic induction. The author has made experiments on four telephones--a Bell receiver, two Siemens receivers, and an Apel receiver--all four transmitting speech with equal distinctness. Their effective resistances and self-inductions were measured for frequencies up to 16,000, the source of...
